

Notes for `finest.csv`

-There are some characters that actually occur twice in the matrix, e.g. characters 268=380 and 275=379. Also, in some cases these guys just “renamed” structures (*i.e.* mesoscutellar ridge to mesoscutellar carina and transscutal ridge to transscutal carina) that was a pain in the butt to fix (carina is external and ridge is internal). Really sloppy work...wonder who did actually checked the dataset from the coauthors...

-When the [position](#) of one structure is given relative to another structure or when I post-composed an anatomical structure or when two structures were compared, I included both HAO classes in the statement

-presence/absence and number characters (e.g. number of palpomeres) are expressed using [amount](#)

-“fusion” (presence/absence of conjunctiva separating two sclerites) and sclerotization level are referred as [structure](#)

-Most common PATO terms:
